Manager’s Message

As 2010 draws to a close, SPAN can reflect on yet another busy year supporting research projects across the many disciplines of the university. These have ranged from tracking individual sheep within a paddock to following flood pulses through the Murray-Darling Basin and from creating the new campus maps to ‘mapping’ the mouth feel of wines.

We have also added to our research support capacity with survey and questionnaire assistance, including access to the professional version of on line survey software, SurveyMonkey.

The addition of a real time corrected GPS unit to the equipment SPAN has available for researchers to use, allows collection of highly accurate location data. Coupled with the new Getac hand held PDA with an inbuilt camera, standardised and complete collection of field data is easy and accurate.

Finally, I would like to thank the talented SPAN staff for their valuable contributions to all the projects they have been involved with this year. We look forward to another productive year in 2011.

I hope everyone has a Merry Christmas and a safe and happy New Year.

Gail Fuller

Can SPAN help you?

SPAN might be able to assist your research in ways you do not anticipate. From simple data retrieval and map making to complex spatial and statistical data analysis, SPAN is available to enhance the quality of your research. If you are a researcher, academic or postgraduate student at Charles Sturt University and believe that some aspect of your research might be assisted by using our skills, do not hesitate to contact the Manager, Gail Fuller, on 32004 or gfuller@csu.edu.au to discuss your project requirements.

Equipment

More accurate location fix than standard hand held GPS.

The new StarFire™ real time corrected GPS gives a location fix to approximately 50cm accuracy in the field without the need for post processing back at the desk. StarFire™ utilizes a network of more than 60 GPS reference stations around the world to compute GPS satellite orbit and clock corrections. These corrections are broadcast via three geostationary satellites, providing worldwide coverage and enabling precise real-time navigation without local ground base stations.

Carried in a back pack, this system conveniently allows the operator to collect location details and enter field data into the hand held PDA.

As there is an annual fee for the corrections broadcast, there will be a small charge for use of this equipment to cover the subscription costs.

Two further enhancements to SPAN’s location equipment are the TruPulse 360 and Leica Disto 8 laser measuring devices. The TruPulse measures distances to an accuracy of 30cm over hundreds of metres, as well as inclination (slope) and azimuth to better than 1°. The Disto is even more accurate over shorter distances, 1mm over 200m, and can plot profiles and calculate areas.

Scan and copy large documents in colour

SPAN is now able to scan and copy documents up to A0 in size in full colour. This capability complements SPAN’s poster printing service. The Descan system consists of a frame and back board with a movable calibrated track on which a scanning head runs. The scanner head track is moved across the document allowing strips of the document to be scanned consecutively. These strips are then merged together by the Descan software to give a complete image of the entire document.

The scanner track is mounted over a clear glass base, which is lowered onto the object to be scanned so that no contact is made between it and the scanning head. This protects the object, ensuring that no damage is done to even fragile materials such as very old documents or fine fabrics.

Handheld GPS / PDA

The Getac PS236 fully GIS capable, rugged PDA with in built GPS, compass, altimeter and 3MP camera can be used for collecting and processing data in the field. Forms can be created for the device to ensure consistent, standardised and complete data collection.
‘Water on Tap?’ exhibition
SPAN staff member, Deanna Duffy, assisted Dr Rachel Whitsed to create a virtual fly-over of the Murray River for the ‘Water on Tap?’ exhibition at the Albury Art Gallery (Deanna and Rachel are pictured at right with the flyover projected onto the gallery wall). Celebrating National Water Week (17 – 23 October), the water themed exhibition is designed to help the community understand, protect and conserve Australia’s precious water resources and habitat. It includes photography, textiles, mixed media, sound, sculpture, video and the virtual fly-over of the river.

Deanna utilised Google Earth Pro and satellite imagery to generate the flyover, which begins at the source of the river in Kosiuszko National Park and follows its route to Barmah near Echuca. The exhibition is supported by Charles Sturt University, the Institute for Land Water and Society, the Murray Catchment Management Authority and Albury City and will be open until 12th December.

Survey and questionnaire design
Following training with the Australian Bureau of Statistics, SPAN is now able to offer researchers assistance with designing surveys and creating questionnaires. To develop this capability further, SPAN has subscribed to the Professional version of SurveyMonkey, an on line survey system.

SPAN has created and implemented an on line survey for Professor Nick O’Brien and Adjunct Professor Mick Keelty of CSU’s Australian Graduate School of Policing. The survey will investigate the implications of ‘social networking’ for covert police operations. This survey will collect information to measure the level of exposure from personal identification data shared on social networking sites such as Facebook and MySpace. Data is currently being collected from various cohorts of police and security personnel who could potentially be involved in covert operations.

Following analysis of the data collected in the survey, current government policy will be reviewed and the need for innovative ways of dealing with the identified problems will be examined.
ArcGIS 10 has now been released and SPAN staff are familiarising themselves with the various changes in the software before rolling it out to other users. Licensing for the new version should be more straightforward, with licences able to be checked out for longer periods off network.

According to ESRI, the software creators, this release provides greater ease of use, more powerful analysis tools, new mobile platforms and additional web GIS applications. It also promotes collaboration via an online system for using, sharing, and organising geographic content.

ArcGIS now includes Python scripting for automating common tasks and analyses. Using Python, the capabilities of ArcGIS can be combined with other scientific programming to create powerful solutions.

This release also makes it much easier to see data in 3D and introduces the notion of time in both visualisation and analysis. Users can create, manage, and visualise time-aware data.

Along with the release of ArcGIS 10, a new version of the mobile mapping software ArcPad has also been released. ArcPad 10 has had performance improvements and quality enhancements as well as the addition of some new capabilities, such as a new dynamic toolbar that allows quick capture of new features with a simple tap on the screen. This toolbar requires no customisation and can be used across all of the user's ArcPad projects.
